

Practical Generative AI

A short, repository-owned document for demonstrating portable PDF text extraction.

FORMAT Hands-on lab	LEVEL Introductory	DURATION 4 modules
------------------------	-----------------------	-----------------------

Learning objectives

- Compare direct provider SDK calls with framework integrations.
- Keep credentials outside source control with environment variables.
- Load local text and PDF content with portable repository paths.
- Separate deterministic tests from network and model execution.

Lab sequence

01	Provider basics	Run one prompt through a hosted Gemini model.
02	Local inference	Compare a Hugging Face pipeline and an Ollama model.
03	Document loading	Extract text from repository-owned TXT and PDF files.
04	Validation	Run formatting, linting, compilation, and offline tests.

Evaluation checklist

A successful example is readable, reproducible on a fresh clone, explicit about external prerequisites, and safe to import without starting a model download or API request.

This synthetic document was created for the GenerativeAI example repository. It contains no personal, academic, or third-party course data.
